Jira Search + Create JG

Learning log · BA & PM Bootcamp at dibimbing.id

I set up a Jira space for an e-money app.

Here's how it went, from picking the template to making sure nothing skips QA.

TO DO 9

Sign up with phone number + OTP
USER AUTHENTICATION DIB-2

Fix PIN hashing algorithm vulnerability
USER AUTHENTICATION DIB-18

Implement double-entry ledger system
DIGITAL WALLET DIB-36

my first real backlog :)

The case study

A digital wallet app, broken into 4 epics

my job: set it up like the PM would

Spaces

€ E-Money App - Wallet

Summary | Timeline | Backlog | Board | List

EPICS

User Authentication & Onboarding (KYC)
Phone sign-up with OTP, KTP + selfie verification, secure PIN, biometric login
5 work items

Digital Wallet Balance & Core Ledger
Balance and history, double-entry ledger, balance limits per user tier
5 work items

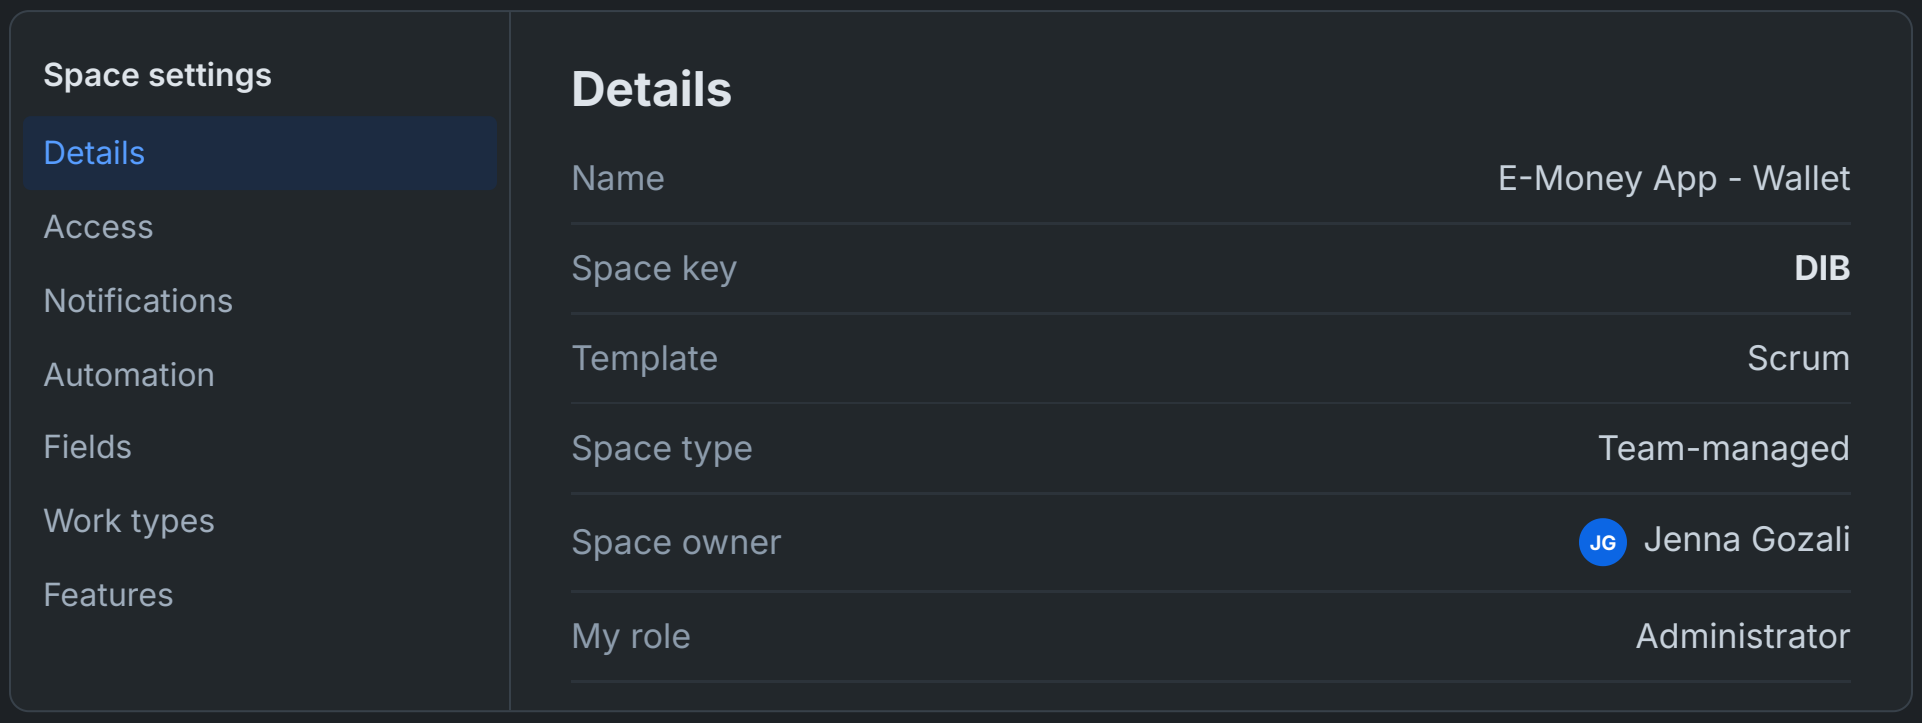

Top-Up & Cash-In
Virtual Account top-up, minimarket payment codes, duplicate-payment protection
5 work items

P2P Transfer & QRIS Payment
Send money by phone number, QRIS scan-to-pay, fraud detection rules
5 work items

Our mentor handed us a full product backlog: **4 epics, 20 work items**, each with acceptance criteria and sub-tasks for Designer, Fullstack, Data Engineer and QA.

Phase 1 · Project initiation & governance

First, build the right "container"

1.1 **Create the space**
Projects → Create project (now called a "space").

1.2 **Choose the Scrum template**
Not Kanban or Bug Tracking, because we work in sprints.

1.3 **Pick Team-managed**
Full control to customise workflows and fields.

1.4 **Name it after the product**
Anyone can tell what the space is for.

1.5 **Set a short space key**
3–4 characters that prefix every ticket ID.

1.6 **Check access**
Space settings → Access: I'm listed as Administrator.

every ticket is now DIB-something

The decision behind it

Why Scrum, and why team-managed

	Team-managed ✓	Company-managed
Best for	Teams that want a simple setup and move fast	Orgs that need the same setup across many projects
Who configures	The space owner (me)	A Jira admin
Workflows & fields	Edited directly by the team	Shared schemes across spaces
Permissions	Open, limited or private	Custom permission schemes
Boards	One board per space	Many boards, across spaces
Advanced roadmaps	Not available	Premium plans

WHY THE SCRUM TEMPLATE

- [x] Backlog and sprints are built in
- [x] Velocity and burndown charts to check sprint health
- [x] Story points to plan the team's capacity

startup speed vs. corporate standards

Nothing reaches Done without passing Testing

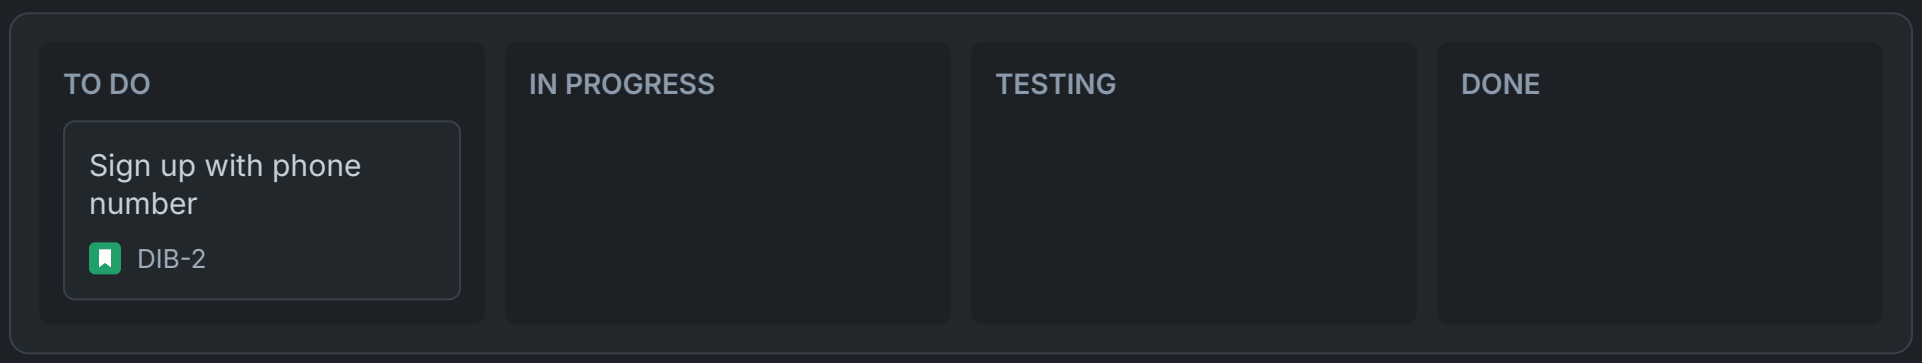

2.1 **Open the workflow editor**
Space settings → Work types → Edit workflow.

2.2 **Add a new status**
Called "In Testing", our QA stage.

2.3 **Connect the transitions**
In Progress → In Testing, and In Testing → Done.

Mapping statuses to columns the team can see

2.4 **Open the board settings**

Board → ••• → Configure board / columns.

2.5 **Add a "Testing" column**

Drag the In Testing status into it so it shows on the board.

Turning epics into a real backlog

2 epics done,
2 to go

Summary | Timeline | Board | **Backlog** | List

Backlog (9 work items) — Create sprint

☐	DIB-2	As a new user, I want to sign up with my phone number...	USER AUTH	TO DO
☐	DIB-8	As an unverified user, I want to verify my KTP and selfie...	USER AUTH	TO DO
☐	DIB-14	Research Identity Verification Vendor (e-KYC)	USER AUTH	TO DO
☐	DIB-18	Fix PIN Hashing Algorithm Vulnerability	USER AUTH	TO DO
☐	DIB-22	Security Hardening - Biometric Authentication	USER AUTH	TO DO
☐	DIB-27	As a user, I want to see my balance and transaction history...	DIGITAL WALLET	TO DO
☐	DIB-36	Implement Double-Entry Ledger System Infrastructure	DIGITAL WALLET	TO DO
☐	DIB-41	Race Condition on Concurrent Transfers → Negative Balance	DIGITAL WALLET	TO DO
☐	DIB-44	As an unverified user, I want a warning when a top-up exceeds my limit...	DIGITAL WALLET	TO DO

+ Create

Epic → Story Task Bug → Sub-task

3.1 **Create the epic**
Create → Epic, named after a big feature.

3.2–3.3 **Add work items under it**
Each linked to the epic as its parent, with acceptance criteria in the description.

3.4–3.5 **Summary, priority, labels**
High / Medium / Low, plus labels like MVP or Backend for filtering.

What a well-filled ticket looks like

USER AUTH / DIB-2

As a new user, I want to sign up with my phone number so I can access the e-wallet quickly

Value Score	100

Description

Acceptance criteria

1. Valid number format: +62 or 08
2. 6-digit OTP, valid for 60 seconds
3. Max 3 OTP resends per hour
4. New account created as Unverified

Subtasks

DIB-3	Design the phone sign-up and OTP screens	TO DO
DIB-4	Build the register API + send OTP via SMS gateway	TO DO
DIB-5	Build the sign-up form and OTP countdown	TO DO
DIB-6	Pipe new sign-up logs to the data warehouse	TO DO
DIB-7	Test cases: number validation, expired OTP, rate limit	TO DO

TO DO

effort AND value, side by side

Details

Assignee	Unassigned
Priority	▲ High
Labels	MVP, Backend
Parent	USER AUTH
Story point estimate	5

4.1–4.2 **Add a custom Number field**
Work types → Story → drag a Number field in, name it "Value Score".

4.3 **Move it to the top**
Right under Summary/Description, so it's visible during refinement.

4.4–4.5 **Check Story Points, then test**
Story Point Estimate is on; entered 100 in Value Score to try it.

Before calling it done

My final self-check

Activity Comments History Work log

JG **Jenna Gozali** · just now

Final self-check before I call the setup done:

- [x] Does my workflow force every ticket through Testing before it counts as Done?
- [x] Is Value Score at the top of the ticket, so I can compare priorities quickly?
- [x] Is the acceptance criteria clearly written in every ticket's description?

WHAT CLICKED FOR ME

The rules behind the board matter as much as the tickets on it. Coming from data analytics, it felt a lot like data quality, just applied to how a team works.

What I'm taking away

Skills I practised in this session
